

The most valuable thing I learned from this project was how to use static analysis tools to see how complex a code base was and what kind of errors to look out for. The least valuable thing I learned from was how to use gradlew as a building script. My most significant contribution was the use cases and Use Case diagram. The contribution I appreciated the most was the domain diagram from Will. The most challenging part of the project was creating the sequence diagram and figuring out how the objects interact.

The strongest aspect of our feature design was the level of effort estimates. A future change that may cause a rework of our feature would be if more environment variable being added. In order to improve this assignment in the future, you should show some examples of diagram we should be making and why these diagrams are better than other diagrams. I think you should continue to have weekly reviews of the progress being made by the groups. I would give more details and example of what is needed each week.
